Generics (1.5v)

136

44

- 1) Introduction
- 2) Generic Classes
- 3) Bounded types
- 4) Generic methods
- 5) Wild Card Character?
- 6) Communication with non-Generic Code.
- 7) Conclusions.

Introduction :-

- Arrays are always safe w.r.t type.
- For example, if our programme requirement is to add only String Objects then we can go for String[] array. For this array we can add only String type objects, by mistake if we are trying to add any other type we will get Compiletime Error.

Ex:- `String[] s = new String[600];`

`s[0] = "durga"; ✓`

`s[1] = "pavan"; ✓`

`s[2] = new Student(); ✗`

Type-Safe.

C.E:- Incompatible types

Found: Student

Required: String

→ Hence In The Case of Arrays we can always give the guarantee about the type of elements. String[] array contains only String objects. (i.e. Strings) due to this arrays are always safe to use w.r.t type.

→ But Collections are not safe to use w.r.t type. For Example if our programme requirement is to hold only String objects & if we are using ArrayList, By mistake if we are trying to add any other type to the list we won't get any Compiletime-Error But program may fail at Runtime.

Ex:-

```
ArrayList l = new ArrayList();
```

```
l.add("durga");
```

```
l.add("Sainu");
```

```
l.add(new Student());
```

```
...
```

```
✓ String name1 = (String) l.get(0);
```

```
✓ String name2 = (String) l.get(1);
```

```
✗ String name3 = (String) l.get(2);
```

↓
R.E!: ClassCastException.

→ There is no guarantee that Collection can hold a particular type of objects. Hence w.r.t type Collections are not safe to use.

Case 2 :-

→ In the case of Arrays at the time of retrieval it is not required to perform any TypeCasting.

Ex:-
`String[] s = new String[600];
s[0] = "durga";
...`

`String name1 = s[0];`

TypeCasting is not required.

→ But in the case of Collections at the time of retrieval compulsory we should perform TypeCasting otherwise we will get `CompileTimeError`.

Ex:-
`ArrayList l = new ArrayList();
l.add("durga");
...`

`String name1 = l.get(0);`

C.E! Incompatible types
found : object
required : String

But

`String name1 = (String)l.get(0);` ✓

→ Hence, in the case of Collections TypeCasting is mandatory which is a bigger headache to the programmer.

→ To overcome the above problems of Collections (Type Safe & TypeCast)

Sun people introduced Generics Concepts in 1.5 Version. Hence the

main objectives of Generic Concepts are,

Hence the main objectives of Generics Concepts are,

1) To provide Type Safety to the Collections. So that they can hold only a particular type of objects.

2) To resolve Type Casting problems.

→ For Example to hold only String type of objects a Generic version of ArrayList we can declare as follows.

ArrayList<String> l = new ArrayList<String>();

Annotations:
- **parameter-type**: points to `String` in `<String>`
- **Base type**: points to `ArrayList`

→ For this ArrayList we can add only String type of Objects, by mistake, if we are trying to add any other type we will get Compiletime Error.
i.e., we are getting Type-Safety.

`l.add("duraga");` ✓

`l.add("Sainu");` ✓

`l.add("10");` ✓

`l.add(10);` ✗ C.E! - Cannot find Symbol

Symbol: method add(int)

Location: Class ArrayList<String>

→ At the time of retrieval it is not required to perform any Type Casting.

`String name1 = l.get(0);` ✓

↙
Type Casting is not required

Conclusion 1 :-

- Usage of parent class reference to hold child class objects is considered as polymorphism.
- Polymorphism Concept is applicable only for base type. but not for parameter type.

Ex:-

Base type ← `ArrayList < Integer > l = new ArrayList < Integer > ();`

parameter type.

- ✓ `List < Integer > l = new ArrayList < Integer > ();`
- ✓ `Collection < Integer > l = new ArrayList < Integer > ();`
- ✗ `List < Object > l = new ArrayList < Integer > ();`

C.E!:- Incompatible types

Found: `AL < Integer >`
Required: `List < Object Integer >`

Conclusion 2 :-

- For the parameter type we can use any class or interface name & we can't use primitive type. violation leads to Compiletime Error.

ex:- `ArrayList < int > l = new ArrayList < int > ();`

C.E!:-
Unexpected type

Found: `int`
Required: reference

C.E!:-
Unexpected type

Found: `int`

Required: reference

Generic - classes :-

→ Until 1.4v a non-Generic version of ArrayList class is declared as follows.

```
class ArrayList
{
    add(Object o);
    Object get(int index)
}
```

- The argument to the add() method is Object. Hence we can add any type of object due to this we are not getting Type-Safety.
- The return type of get() method is Object, hence at the time of retrieval compulsory we should perform Type Casting.
- But in 1.5v a Generic version of ArrayList class is declared as follows.

```
class ArrayList<T>
{
    add<T> t;
    T get(int index)
}
```

↖ Type parameter.

- Based on our runtime requirement Type parameter 'T' will be replaced with corresponding provided type.

179
47

→ For Example, To hold only String type of object we have to Create Generic version of ArrayList Object as follows.

```
ArrayList<String> l = new ArrayList<String>();
```

→ For this requirement the corresponding loaded version of ArrayList Class is,

```
Class ArrayList<String>
{
    add (String s)
    String get (int index)
}
```

→ add() method Can take String as the argument hence we can add only String type of objects. By mistake if we are trying to add any other type we will get Compiletime Error. i.e, we are getting Type-Safety.

→ The return type of get() method is String, Hence at the time of Retrieval we Can assign directly to the String type variable it is Not required to perform any TypeCasting.

Note:-

1) As the Type parameter we Can use any valid Java identifier but it is Convention to use "T". e

Ex:-	Class AL<X>	Class AL<Durga>
✓	{	{
	}	}

2) we can pass any no. of type parameters but & need not be one. class

ex:- `Class HashMap<K,V>`

`{`

`}`

`HashMap<String, Integer> m = new HashMap<String, Integer>()`

key type \swarrow
value type \nwarrow

→ Through Generics we are associating a type parameter to the classes. Such type of parameterized classes are called Generic classes.

→ we can define our own Generic classes also.

Ex:-

`class Gen<T>`

`{`

`T ob;`

`Gen(T ob)`

`{`

`this.ob = ob;`

`{`

`public void show()`

`{`

`S.o.pln("The type of ob is : " + ob.getClass().getName());`

`}`

`public T getOb()`

`{`

`return ob;`

`}`

Class GenDemo

{

p.s.v.m(String[] args)

{

Gen<String> g₁ = new Gen<String>("durga");

① g₁.show(); // the type of ob is : java.lang.String
S.o.pln(g₁.getOb()); durga

Gen<Integer> g₂ = new Gen<Integer>(10);

② g₂.show(); // the type of ob is : java.lang.Integer.
S.o.pln(g₂.getOb()); 10

{

}

⇒ Bounded Types:-

→ we can bound the type parameter for a particular range by using extends keyword.

ex(1):-

Class Test<T>

{

}

→ As the type parameter we can pass any type hence it is UnBounded type.

✓ Test<String> t₁ = new Test<String>();

✓ Test<Integer> t₂ = new Test<Integer>();

Ex 2: Class Test < T extends Number >
 {
 }

→ As the type parameter we can pass either Number type or its child classes. It is bounded type.

✓ Test < Integer > t₁ = new Test < Integer > ();

X Test < String > t₂ = new Test < String > ();

C.E: Type parameter java.lang.String is not with its bound

→ we can't bound type parameter by using implements & Super keywords :

Ex 1:- ① Class Test < T implements Runnable >

X {
 }

X ② Class Test < T Super Integer >

{
 }

But,

→ implements keyword purpose we can survive by using extends keyword only

Ex 1: Class Test < T extends X >

{

↳ class / interface.

}

→ X → Can be either class/interface.

→ if X is a class then as the type parameter we can provide either X type or its child classes.

→ if X is an interface as the type parameter we can provide either X type or its implementation classes.

ex:-

```
class Test < T extends Runnable >
```

```
{
```

```
{
```

✓ Test < Runnable > $t_1 = \text{new Test} < \text{Runnable} > ();$

✓ Test < Thread > $t_2 = \text{new Test} < \text{Thread} > ();$

✗ Test < String > $t = \text{new Test} < \text{String} > ();$

← C.E.:-

Type parameter java.lang.String is not within its Bound

→ We can Bound the Type parameter even in Combination also.

ex:-

```
class Test < T extends Number & Runnable >
```

→ As the Type parameters we can pass any type which is the child class of Number & implements Runnable interface.

ex:-
① class Test < T extends Runnable & Comparable >

✓ ② class Test < T extends Number & Runnable & Comparable >

✗ ③ class Test < T extends Number & Thread >

→ We can't extend more than

one class at a time.

✗ ⑤ Class Test < T extends Runnable & Number >

→ we have to take first class & then interface.

Generic Methods & Wild Card Character ?

→ ① $m_1(\text{ArrayList} < \text{String} > l)$ ✓

→ This method is applicable for $\text{ArrayList} < \text{String} >$ (ArrayList of only String type).

→ Within the method we can add String-type objects & null to the list. If we are trying to add any other type we will get compilation error.

-Error.

```
ex: m1( ArrayList < String > l )  
    {  
        l.add("A"); ✓  
        l.add(null); ✓  
        l.add(10); X  
    }
```

② $m_1(\text{ArrayList} < ? \text{ extends } X > l)$ ✓

→ we can call this method by passing ArrayList of any type. But within the method we can't add any type except null to the list. Because we don't know the type exactly.

② ex: $m_1(\text{ArrayList} < ? > l)$
 {
 l.add(null); ✓
 l.add("A"); X
 l.add(10); X
 }

3) $m_1(\text{ArrayList} < ? \text{ extends } x > l)$ ✓

→ If x is a class then we can call this method by passing ArrayList of either x type or its child classes.

→ If x is an interface then we can call this method by passing ArrayList of either x type or its implementation class.

→ In this case also we can't add any type of elements to the list Except null.

4) $m_1(\text{ArrayList} < ? \text{ Super } x > l)$ ✓

→ If x is a class then this method is applicable for ArrayList of either x type or its Super classes.

→ If x is an interface then this method is applicable for ArrayList of either x type or Super classes of implementation class of x .

→ With in the method we can add only x type Objects & null to the List

Q) Which of the following declarations are valid?

✓ ① $\text{AL} < \text{String} > l = \text{new AL} < \text{String} > ();$

✓ ② $\text{AL} < ? > l = \text{new AL} < \text{String} > ();$

✓ ③ $\text{AL} < ? \text{ extends String} > l = \text{new AL} < \text{String} > ();$

✓ ④ $\text{AL} < ? \text{ Super String} > l = \text{new AL} < \text{String} > ();$

✓ ⑤ $\text{AL} < ? \text{ extends Object} > l = \text{new AL} < \text{String} > ();$

✓ ⑥ AL < ? extends Number > l = new AL < Integer > ();

✗ ⑦ AL < ? extends Number > l = new AL < String > ();

↙
C.E! Incompatible types

Found: AL < String >

Required: AL < ? extends
Number >

✗ ⑧ AL < ? > l = new AL < ? extends Number > ();

✗ ⑨ AL < ? > l = new AL < ? > ();

↙
C.E! unexpected type

Found: ?

Required: Class or interface with/out
bounds.

→ We can define the type parameter either at class-level or
at method-level.

Declaring type parameter at class level:-

```
class Test <T>
```

```
{
```

```
    T ob;
```

```
    public T get()
```

```
    {
```

```
        return ob;
```

```
    }
```

Declaring Type parameter at method-level:-

→ we have to declare the type parameter just before return type.

- ✓ ① `<T extends Number>`
- ✓ ② `<T implements Runnable>`
- ✓ ③ `<T implements Number & Runnable>`
- ✓ ④ `<T extends Runnable & Comparable>`
- X ⑤ `<T extends Number & Thread>`
- X ⑥ `<T extends Runnable & Thread>`

Communication with non-Generic Code :-

→ To provide compatibility with old version SUN people compromised the concept of Generics in very few areas. The following is one such area.

ex:-

```

class Test
{
    p.s.v.m(String[] args)
    {
        AL <String> l = new AL <String>();
        l.add('A');
    }
}
      
```

Ex1.-

Class Test

```

{
  P. S.v.m(——)
  {
    AL<String> l = new AL<String>();
    l.add("A");
    // l.add(10); C.E
    m1(l);
    S.o.pln(l); [A, 10, 10.5, true]
    // l.add(10); C.E
  }
}

```

Generic area

```

{
  static
  public void m1(AL l)
  {
    l.add(10); ✓
    l.add(10.5); ✓
    l.add(true);
  }
}

```

Non-Generic area

Conclusions !.

- ④ Generics Concepts is applicable only at Compiletime to provide type safety & to resolve type casting problems. At Runtime there is no Suchtype of Concept. Hence the following declarations are equal,

Ex1.-

```

✓
AL l = new AL();
AL l = new AL<String>();
AL l = new AL<Integer>();

```

all are equal

ex. - ArrayList l = new ArrayList<String>();

184
52

l.add("A"); ✓

l.add(10); ✓

l.add(true); ✓

System.out.println(l); [A, 10, true]

→ The following two declarations are equal & there is no difference

both are
equal

1) AL<String> l = new AL<String>();

2) AL<String> l = new AL();
