Font Weight in CSS

In CSS, you can adjust the font weight of text elements to make them bolder or lighter. The `font-weight` property is used to control the thickness of the characters.

Example:

```css
/* Set font weight to bold */
.text-bold {
  font-weight: bold;
}

/* Set font weight to lighter */
.text-light {
  font-weight: lighter;
}

/* Set font weight to a specific numerical value (400 is normal, 700 is bol
.text-custom-weight {
  font-weight: 600;
}
```

Gradients in CSS

CSS gradients allow you to create smooth transitions between two or more colors. Gradients can be applied to backgrounds or text, providing attractive visual effects.

Linear Gradient Example:

```css
/* Linear gradient from top to bottom */
.linear-gradient {
  background-image: linear-gradient(to bottom, #ff0000, #00ff00);
}

/* Linear gradient from left to right */
.linear-gradient-horizontal {
```

```
  background-image: linear-gradient(to right, #0000ff, #ffff00);
}
```

Radial Gradient Example:

```
/* Radial gradient */
.radial-gradient {
  background-image: radial-gradient(circle, #ff0000, #00ff00);
}
```

Gradients offer flexible options, such as specifying the starting and ending points, adding multiple color stops, and choosing different shapes for the gradient.

Remember that CSS gradients are widely supported in modern browsers and can be a great addition to your web design toolbox.
